Important notice and conditions relating to this document

This paper has been prepared for and issued by Fetch.AI Foundation Pte Ltd for informational purposes only and may be amended, superseded or replaced. Access to, the use and reliance on this paper is subject to legal terms (https://fetch.ai/legals), in particular the General Disclaimer and Conditions set out at https://fetch.ai/legals/disclaimer. In addition:

- This document contains forward-looking statements, projections and information. Such statements involve unknown risks and uncertainties that may cause actual results to be materially different from any future performance suggested herein. Neither Fetch.AI Foundation Pte Ltd nor any of its affiliates are making representations or warranties that any such forward-looking statements are either accurate or adequate.

- This document does not constitute an offer to buy or sell or a solicitation of an offer to buy or sell any tokens contemplated herein. The offering for sale or purchase of any of the tokens described herein has not been approved by the Monetary Authority of Singapore, the U.S. Securities and Exchange Commission or any other regulatory authority. Individuals in certain jurisdictions are restricted from purchasing tokens in jurisdictions where the tokens would be deemed to be investment securities and pursuant to other terms and conditions associated with Fetch.AI Foundation Pte Ltd's or Binance Launchpad's offering of tokens.

- This document does not purport to identify or define all of the risks which may be associated with the tokens or participating in the Fetch.AI protocol and platform.

- Contributors should conduct an independent investigation and analysis as they feel is appropriate including, without limitation, consultation with their financial, legal, tax and accounting advisors.

- Please note that all dates and figures are subject to changes dependent on market conditions and other restrictions.

- The information in this document should not be construed as investment advice or as a recommendation to purchase the tokens or participate in the Fetch.AI protocol and platform.

- This document is to be read only by potential contributors who are eligible to purchase tokens and who have such knowledge and experience in financial and business matters as to be capable of evaluating the merits and risks of purchasing tokens or participating in the Fetch.AI protocol and platform.

- Contributors to the project should be able to bear the risks of loss associated with the purchase of tokens or their participation in the Fetch.AI protocol and platform.

The distribution or dissemination of this document may be prohibited or restricted by the laws, regulatory requirements and rules of certain jurisdictions. In the case where any such restrictions apply to you, you are responsible for informing yourself about, and observing any restrictions which apply to your possession of this document. This document may not be redistributed,

Key summary information

- **Please carefully read the disclaimer and notice on page 3 of this document and at** https://fetch.ai/legals/disclaimer. You can find further key information and documentation at https://fetch.ai.

- **Fetch.AI Foundation Pte Ltd (the issuer) will be issuing 1,152,997,575 tokens (FET tokens), initially as ERC-20 tokens on the Ethereum network as part of a Token Generation Event (TGE).**

- The hard-cap for the public fundraising round on Binance Launchpad is $6 million USD, for 6% of the tokens.

- The quantity and price of the FET tokens available in the Public Sale (planned for in February 2019) has not been determined, but this information will be available on our dedicated token sale website, https://token.fetch.ai.

- Any tokens unsold in the token sale will remain with the issuer for allocation no sooner than 12 months after the TGE and will be released periodically over a 24 month period

- An additional 17.4% of FET tokens be released in a controlled manner, no sooner than 12 months after the TGE and over a staged period of 5 years. This will bring the minimum number of tokens directly available to the public to 30%.

- FET tokens will be exchanged for sub-divisible, native Fetch.AI tokens at a fixed conversion rate which is expected to be approximately one-to-one.

- Further details about the public sale process will be made nearer the TGE (e.g. the minimum and maximum number of tokens that can be purchased by an individual). See the section in this document entitled "More Information" for details as to how to keep up-to-date on news and other information.

- The issuer will retain 20% of the tokens, vesting over a period of four years, to support and develop the Fetch.AI ecosystem.

- The ERC-20 token is required to participate in the public test network: the development, deployment and use of Fetch.AI code and assets as part of the Fetch.AI network, protocol and platform.

- Mining rewards consist of 15% of the native Fetch.AI tokens. These additional incentives are replaced over time by the value generated by delivering services to agents: search, discovery, predictions and trust information. Mining starts at the release of the main network towards the end of 2019.

Token Issuance by Fetch.AI Foundation Pte Ltd

The objective of this document is to explain the Token Economics relating to the Token Issuance by Fetch.AI Foundation Pte Ltd, a company incorporated in Singapore.

Registration Number: 201810667K.
Registered Address: 50 Raffles Place #32-01, Singapore Land Tower, Singapore 048623

This company is the issuer whose sole purpose is to:

1. Issue and distribute FET tokens and the native Fetch.AI tokens

2. Oversee the development and maintenance of the Fetch.AI protocol and platform

3. Oversee the fair and proper operation of the Fetch.AI network

4. Have the rights to use any intellectual property of the Fetch.AI protocol and platform

Fetch.AI project overview

Fetch.AI is a decentralised digital representation of the real world in which autonomous software agents perform useful economic work. This means that they can perform tasks, such as delivering data or providing services, and are rewarded with a digital currency for their efforts — the Fetch.AI Token. Their world is organised in multiple useful dimensions, not just geographically; safety, decision points and other economic factors all form ways in which agents can view the space that they inhabit.

The Fetch.AI protocol and network can be considered a method of connecting agents with value to those that need – or might need – that value. It is the missing search-and-discovery for digital entities, allowing intelligent, autonomous agents to find each other effectively in a world that is designed for them, but interfaces seamlessly into the real world. It provides a new, *economic* Internet for the machine-to-machine economy, removing friction and acting as a disintermediation mechanism to increase efficiency and utilisation.

Fetch.AI agents can be thought of as digital entities that represent things, such as data, services, hardware, humans or infrastructure segments. They are able to make decisions on their own behalf as well as on behalf of their stakeholders (individuals, private enterprises and governments, for example).

Fetch.AI's digital world is exposed to agents via its Open Economic Framework (OEF) and is underpinned by unique smart ledger technology to deliver high performance, low cost transactions. The ledger delivers useful proof-of-work (µPoW®) that builds market intelligence and trust over time — growing the value of the network as it is used.

Fetch.AI can be neatly interfaced to existing systems with minimal effort, allowing it to take advantage of the old economy whilst building the new: plug existing data into Fetch.AI and new information markets can emerge spontaneously from the bottom up.

Applications

The applications of such technology are many. By bringing data to life, Fetch.AI solves one of the greatest problems in the data industry today: data can't sell itself. With Fetch.AI, it can. Data is able to actively take advantage of any opportunity to exploit itself in any marketplace, in an environment that's constantly reorganising to make that task as easy as possible. Internet-of-things (IoT) devices inhabited by Fetch.AI agents can increase utilisation by capitalising on short-lived opportunities to sell the information that they possess in existing, as well as novel, information services markets: an agent in a vehicle can provide weather and road conditions by simply relaying the activity of its windscreen wiper and washer activity.

Fetch.AI's decentralised digital world enables and facilitates the emergence of new marketplaces and allows this "unreal estate" to place relevant markets near each other for ease of exploration. The ability of agents to serve as representatives for data, hardware and services enables a better coordinated delivery of highly or even loosely connected services such as transport and

insurance. Fetch.AI creates a huge population of digital data analysts and sales agents who can work together, alone, or with human or corporate masters to reduce the cost of delivering complex solutions in our daily lives.

New opportunities

Fetch.AI's autonomous agents actively push their value out to those who need it or who unknowingly need it. The Open Economic Framework provides a digital world for them to inhabit that grows in value as it is used: over time, the collective intelligence that is formed provides unparalleled guidance allowing for high speed, high reliability transactions. The network's expanding computational power provides all agents with the ability to gain new insights and understanding from their data.

With machine learning technology integrated throughout the system, from the ledger to the agents themselves, it is a network that enables, encourages and deploys intelligence, and that actively creates new knowledge. Fetch.AI provides the node structure, the OEF API, and agent Development Toolkits to make agents easy to deploy.

Entire new industries can be built from the deployment of Autonomous Economic Agents as opportunities exist to replace human intermediaries with trusted digital agents. Previously unprofitable datasets become valuable with Fetch.AI, as the cost and friction of applying them is dramatically reduced. Data and hardware can now get up on their own two feet, get out there and sell themselves entirely free of human intervention.

The Fetch.AI Token

Fetch.AI Foundation Pte Ltd are issuing a fixed number of divisible tokens (FET tokens) that are used on the network as the digital currency for all transactions, as well as for network operations such as secure communications. The native Fetch.AI Tokens, when launched as part of the release of the main network, can also constitute an access deposit in the Fetch.AI network for both nodes and agents wishing to perform certain operations (as a security mechanism that discourages bad behaviour). As Fetch.AI secures its foothold in the data, transport, services, and IoT industries, its token grows in usage and adoption as each sector makes a larger and larger contribution to the Fetch.AI network's economic throughput.

The FET token will be issued on Ethereum for the token sale which entitles the holder to generate Fetch.AI tokens on the public test-network for the purpose of agent and useful proof-of-work development as well as application building and testing. See "The ERC-20 Token" for more information. When the main network is released in the second half of 2019, the ERC-20 tokens issued at the token generation event will be convertible into Fetch.AI tokens. Whilst the ERC-20 Fetch.AI tokens will be eliminated at that point, all development on agents and more will remain. Once the main network is live, mining rewards will commence to encourage node operators to perform additional computing as the value from agent and prediction services grows. Details of how this operation will occur and security procedures surrounding it will be published during 2019 by Fetch.AI.

The "Planned Milestones" section, later in this document, describes additional details of the roadmap towards a native Fetch.AI token.

Role of the Fetch.AI token

The Fetch.AI token is the key method of value exchange on the Fetch.AI network. It is required for all network exchanges, as a refundable method of registering with the network, for staking and as a mechanism for delivering value back to those performing work on the network. The Fetch.AI token allows for autonomous economic agents to *get things done*.

Fetch.AI's token allows agents access to the digital world. It enables them to exist in this world, in multiple locations, and explore it looking for other agents to deliver value to or gain value from. This value can be in the form of services, data, infrastructure use or access to data processing such as AI and ML algorithms.

Fetch.AI tokens can be used for many purposes, the largest five of which are:

- **Ability to connect agents and nodes to the network**. This is an access deposit token that acts as a form of stake to demonstrate desire to behave appropriately. It modulates the ability for bad actors to flood the network with undesirable nodes or agents due to the escalating cost of doing so.

- **Value exchange between agents**. The Fetch.AI token is required in order to allow for two agents, regardless of where they are, to perform a value exchange. The Fetch.AI

token is infinitely divisible, thereby supporting transactions that have very low monetary value, but in aggregate provide new and profound level of insight and opportunity.

- **Access to the digital world**. Fetch.AI tokens are needed to access, view and interact with the decentralised digital world. This is a space optimised for digital entities: an abstract representation of the real world in many dimensions that allows machines to make sense of and work within. The Fetch.AI token is needed to gain access to all aspects of this digital world for agents.

- **Ability to access and develop ledger-based AI/ML algorithms**. The Fetch.AI token enables development of and access to a broad range of machine learning and artificial intelligence tasks that are available on the ledger. These may be primary services, developed by Fetch.AI, such as trust and prediction models, or they may be large-scale independently developed services for network users. Fetch.AI refers to these collectively as *Synergetic Computing*[1].

- **For exchange into Fetch.AI's operational fuel**. Operation costs in Fetch.AI are decoupled from the Fetch.AI token in a similar way to that of "gas" on the Ethereum network, but with additional functionality designed to increase the stability of such a fuel and look at addressing issues associated with high and low-velocity economies. Fetch.AI's operational fuel allows access to processor time for contract execution and services for agents[2].

The ERC-20 Token

At Fetch.AI's Token Generation Event, ERC-20 Fetch.AI tokens will be issued. These are required to access the public test network. Holders of the ERC-20 Fetch.AI token will be able to proportionately generate Fetch.AI test tokens on a regular basis for the purposes of development and testing. Fetch.AI test tokens can be used for many things, including, but not limited to:

- **Agent development**. Holders can develop and test all manner of agents on the Fetch.AI network including those that represent data, services, hardware devices, people or facilitate connections to the existing economy or other decentralised networks.

- **Network participation**. Mostly via the Fetch.AI network participation application (NPA) this involves downloading, installing and using a mobile application specifically designed to convert the device's sensors and information into agents that exist on the Fetch.AI network. It also facilitates direct value exchange using the test tokens and exploration of the Fetch.AI world.

---

[1] See Synergetic Smart Contracts with Fetch.AI https://medium.com/fetch-ai/synergetic-smart-contracts-with-fetch-ai-fbbd5812d767

[2] See section 2.1 of the Technical Introduction Paper (https://fetch.ai/uploads/technical-introduction.pdf) for details on these services. They include, but are not limited to, search, discovery, advertising of services, world-views, ability to "move" on several dimensions around the digital world, communications, registering for opportunistic searches and far more.

FE
TC
H

- **Node development and operating**. Holders can operate nodes on the public test network, provide services to agents and perform processing on behalf of themselves or other users on the network in the form of useful proof-of-work execution.

- **Economic analysis**. Analysis of the network's overall performance and economics, looking at how the utility value per-token is delivered.

- **AI/ML development**. Holders can develop machine learning and artificial intelligence applications and services and have them executed as part of useful proof-of-work. Between such developers and node operators, these applications and services can be delivered to those that want them and the value exchanged accordingly.

Essentially, no part of developing or participating on the Fetch.AI test network can occur without the ERC-20 token. This ERC-20 token acts as the key enabler for access to the test network's existing utility value as well as the component that facilitates the ability to develop and access future utility value.

F E
T C
H

Token Economics

The total number of tokens generated is intended to be 1,152,997,575[3]. No further tokens will be created, but native Fetch.AI tokens can be subdivided indefinitely.

Token allocation
Token Distribution	Amount
Foundation[4]	20.0%
Founders	20.0%
Token Sale (Seed and Private rounds plus Public Sale)	17.6%
Future Releases[5]	17.4%
Mining	15.0%
Advisors	10.0%

---

[3] When the native Fetch.AI tokens are created in late 2019, the exchange of ERC-20 Fetch tokens to native tokens will be made at a fixed conversion rate which is expected to be approximately one-to-one
[4] These tokens are retained by Fetch.AI Foundation Pte Ltd to support the Fetch ecosystem and vest linearly
[5] These tokens will be released to the community for sale no earlier than 12 months after the TGE

FE
TC
H

Token vesting

In order to manage token liquidity and provide stability to the Fetch.AI token, various vesting periods are applied to some of the issued tokens. In particular, those issued to advisors, founders and the foundation are subject to vesting periods of three years. Mining tokens, those that are there to incentivise node operators whilst the value of agent service delivery grows, are introduced over a period of five years. The tokens allocated and their vesting periods can be seen in the table below:

Group	Notes	Vesting period (Commencing from TGE)
Private sale	Tokens sold to seed investors, and during private rounds to VC funds and accredited investors	3 month lockup, then linear vesting over months 4, 5 and 6
Public sale	Issued during public token generation event planned for Q1 2019	None
Future releases	For release to the community no earlier than 12 months after TGE. Releases will take place over a period of up to 5 years, but not more than a third in any one year	To be determined
Unsold	Any tokens unsold in the token sale will remain with the issuer for allocation no sooner than 12 months after the TGE and will be released periodically over a 24 month period	To be determined
Founders	Founders, company shareholders and incentives for core team	3 month lockup after TGE, followed by quarterly vesting 50% year 1 25% year 2 25% year 3
Advisors	Advisors tokens will vest in line with Founders to keep incentives aligned	Quarterly vesting 50% year 1 25% year 2 25% year 3
Foundation	To incentivise network development	Linear vesting over a period of 4 years
Mining	Issued over a 5 year period to incentivise early providers of compute power as network intelligence develops. Release rate tied to network's economic performance	Not applicable

FE
TC
H

Circulating tokens over time
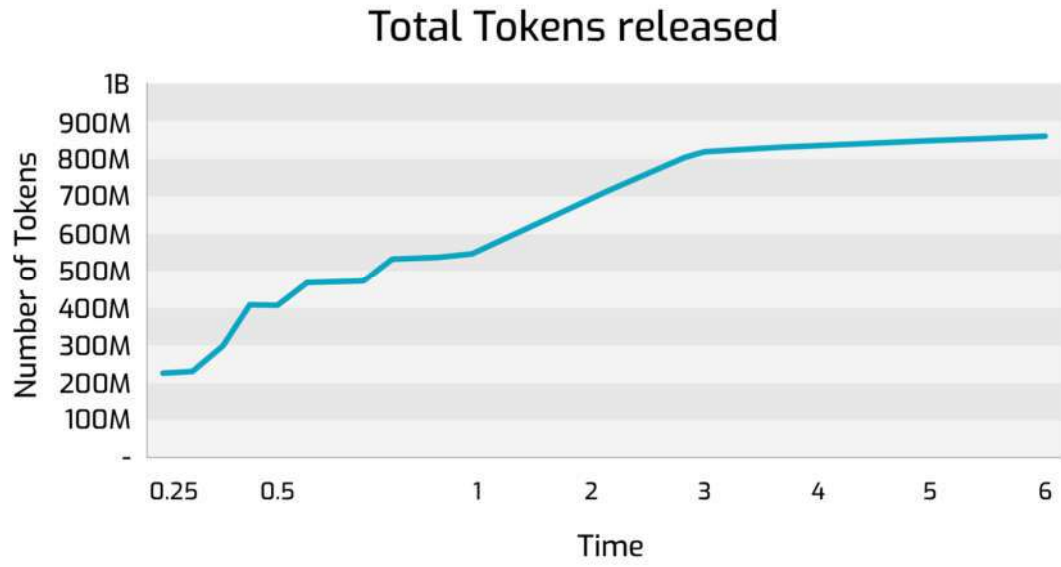

Example token release schedule over 6 years

Economics Overview

In this section we summarise the ledger's consensus mechanism, the Smart Ledger's role, mining rewards and the mechanism by which predictions are generated and the value they deliver.

Consensus formation

Fetch.AI uses a combination of proof-of-stake with proof-of-work to deliver consensus. New blocks are minted through a normal proof-of-stake protocol with the transaction order being determined by the work carried out in between two blocks. This work is recorded on a directed acyclic graph (DAG) that grows between the blocks. The DAG is started with the previous block and terminated by the block minted by proof-of-stake which removes the need for a coordinator.

The purpose of introducing work into proof-of-stake is to optimise the ledger's performance and enable smart (and difficult) decisions and predictions to be made inside the ledger and its smart contracts. Specifically for the block mining, this means that work is aimed at optimising transaction throughput by identifying transactions which can be executed in parallel.

Smart Ledger

Fetch.AI's Smart Ledger allows for complex machine learning and AI solvers to be placed on the ledger. These typically consist of two components:

1. The Smart Contract
2. Data for decisions and predictions

In Fetch.AI, the contract is on the ledger and the data (which may be hundreds of megabytes) are on the DAG. The advantage of the DAG is that it provides a simple method to implement a first-to-find-best-problem-solution protocol. This cannot be directly incorporated into the blockchain itself as blocks are mined through this protocol.

Furthermore, Fetch.AI's ledger is not a data store and it is important to keep it nimble, tightly packed and resource-light. Contracts can perform a variety of applications and nodes keep a shared list of the current best solution to any given problem. Users of the network can pay to execute any solver and the reward is split between those running the code and the originator of it. This provides an ongoing payment mechanism for AI and ML solutions that are placed on Fetch.AI. These can encompass a huge range of possible applications, such as navigation solvers, face recognition, pattern spotters and much, much more.

Some of the Smart Ledger programs are specifically designed to deliver trust, predictions and advanced co-ordination to the agents connected to Fetch.AI. These allow the restructuring of the digital world to suit any given agent observer. These programs can be executed at will by nodes to generate such intelligence and are rewarded, as with any other useful proof-of-work.
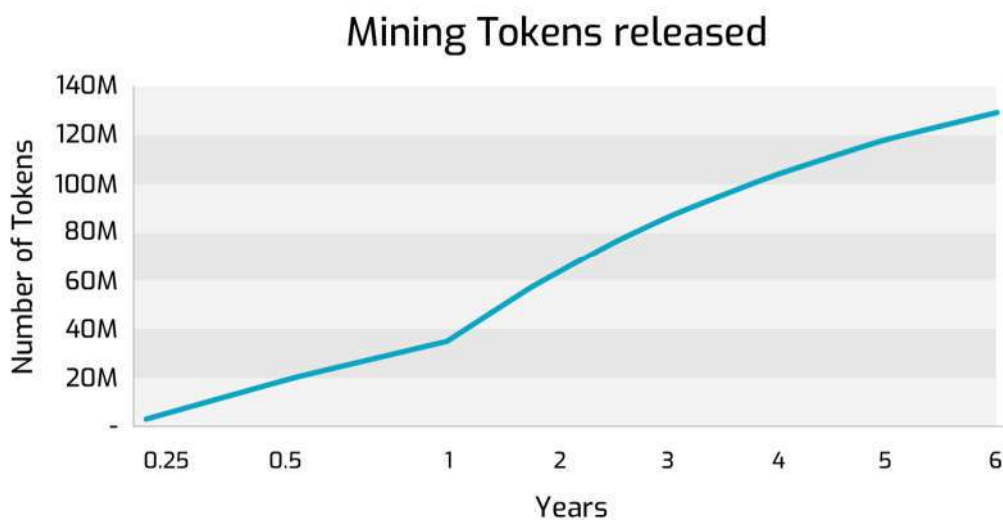

Mining rewards

Each block that is created generates a fixed amount of Fetch.AI tokens that is divided amongst the node that optimised the block and the leader who chose it. The block rewards decay function is subject to further modelling prior to the main network's release later in 2019.

Mining decay function
Example of mining decay

Additionally, miners and the elected leader earn the fees from the transactions.

Mining Tokens released

Mining tokens released (from main-net launch) assuming an approximate 2 year half-life

15% of the issued tokens are provided as mining rewards: tokens issued to those that are performing useful on-ledger computing and consensus calculations in order to optimise network performance and generate trust and prediction information for network users.

As the network's collective intelligence grows, nodes will make most of their value from providing *services to agents*. These services allow agents to view, explore and interact with the

digital world and include the incorporation of prediction models to structure the world. **As the demand for agents grows, so does the demand for nodes to service them.** This demand, and the node income generated by servicing it, directly affects the mining rewards.

Additionally, nodes deliver trust information to agents that allow them to make faster decisions than would otherwise be possible. The token reward for delivering these services grows over time. The mining tokens are present over the initial years of Fetch.AI as an additional incentive whilst this value grows.

Predictions

Fetch.AI's collective intelligence provides predictions and knowledge from data that allows its digital world to adapt to the individual viewing it. These predictions **have value**. A typical agent doing business may use a number of them, some directly and some indirectly.

- <u>Indirect prediction</u> usage comes from value exchanges with other agents that have been introduced by Fetch.AI as potential agents to work with. They also arise when the agent explores the digital world, gathers information about what is around it and does so on one of the several network dimensions. As the quality of these increases, so does the value to the agent: introductions will be more accurate and the world more relevant, thus allowing more economic exchange to occur with less friction.

- <u>Direct prediction</u> use is where an agent accesses one of the nodes that it is connected to in order to receive a prediction based on specific input parameters. As with indirect predictions, the quality and value of these increase over time: they provide market insights to all users of the network.

Fetch.AI are producing detailed economic modelling that will be available throughout 2019 that outline in more detail what the value of these predictions are.

Fundraising goals

The hard-cap for the public fundraising round on Binance Launchpad is $6 million. In total, 6% of the Fetch.AI tokens will be issued.

Use of funds overview and academic partnerships

Staff and salary cost represent the largest single expenditure. Our development headquarters are in Cambridge, UK. Additionally, we have teams in Austria and India. During the full deployment of the Fetch.AI network, we anticipate building locations in Europe, Asia-Pacific and North America.

Significantly, Fetch.AI will nurture, support and leverage the deep expertise and knowledge within the very best academic foundations across the globe. We will power our network development with experts in the many fields, including:

|	
AI & ML	We are partnered with several UK universities including University of Cambridge and the University of Warwick's AIIN group. We continue to develop new relationships to continue to develop our core AL and ML development.
DLT & Blockchain technology	Fetch.AI has already established relationships with UCL London, Warwick Business School and Imperial College, London.
Computational Economics	Given that Fetch.AI represents a dynamic marketplace, it is essential that we apply economic market design, game theory and marketplace modelling to incentivise positive network dynamics and effectively eliminate bad actors. To date, Fetch.AI has already sponsored one post-doctoral researcher at University of Cambridge.
Biochemistry and biology	Fetch.AI's computational platform has applications in drug discovery, genetics and other aspects of systems biochemistry. Fetch.AI are working with a number of academic partners to develop these opportunities.
Multi-agent systems	Two recognised experts in the field of multi-agent simulation and modelling are acting as Advisors to Fetch.AI: Steve Grand, the inventor of complex autonomous agents and Dr Niall Armes, a world-leading biochemist, molecular biologist and entrepreneur.

Annual budgeting

Fetch.AI's expenditure during its first three years will be spent in three primary categories: working capital and other costs, staff and salaries, corporate partnerships and academic partnerships. Fetch.AI believes that corporate and academic partnerships act as accelerators. If, due to challenging market circumstances, investments in these fields are reluctantly reduced, Fetch.AI will still be delivered, but progress will be marginally slower and some opportunities to deploy Fetch.AI may be delayed. This provides Fetch.AI with additional contingency: the core Fetch.AI innovations and systems can be delivered, albeit over a longer period with a slower burn-rate. However, we believe that a project of Fetch.AI's magnitude requires the funding that we present in order to ensure the maximum chance of a stronger delivery.

By far the largest costs Fetch.AI incurs are salaries and working capital for associated costs such as office space, travel and community engagement. Working in the field of artificial intelligence, machine learning, decentralised ledgers and large-scale distributed digital world and agent-based emergent economies, we require to continue to access the finest minds available to us and will continue to do so. Corporate partnerships afford Fetch.AI the chance to build useful applications, grow the value of the network and explore new chances to demonstrate and apply Fetch.AI's unique technology. Academic partnerships place us at the forefront of research and development in our space and assists in hiring and new technology exploration. Collectively, we view all of these categories as important.

From a development perspective, Fetch.AI are changing the proportion that are spent on specific areas of the technology's development as the first three years unfold. The diagram below shows how this will be done. Observe that our initial focus has been on the core network, protocol and key innovations: creating the foundation upon which all else is built. Throughout 2019, we focus on agents, the digital world, AI and ML applications.

As time goes by, a higher proportion of development funds are assigned to pure research and development in Fetch.AI's Advanced Technology Division. This division continues to look at new technology that will power Fetch.AI in the future including improved performance, new features and innovative approaches to machine intelligence.

Fetch: 2018-2019
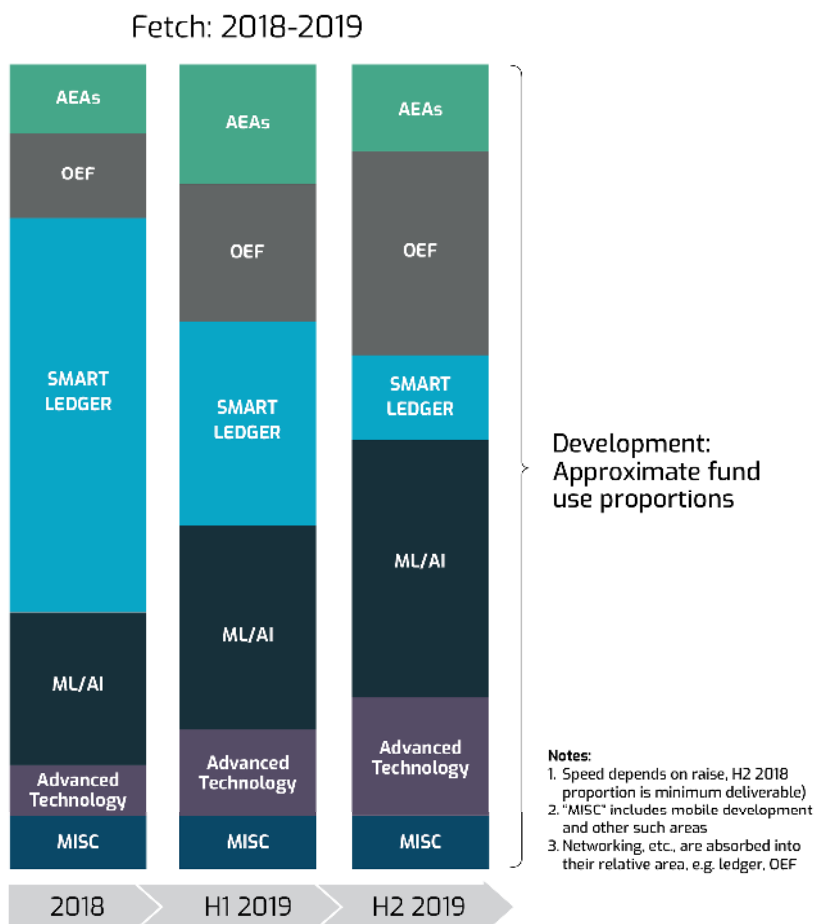

Approximate division of development funds leading up to 2020

The above figure shows approximate division of development funds over the 2018 to 2020 time period. Note the initial focus on the core foundation technologies leading to the higher level digital world, machine learning and AI aspects. Additionally, a higher proportion of development funds are assigned to pure research and development in Fetch.AI's Advanced Technology division that is looking at new approaches to performance, capability and machine intelligence.

Network Development Program

Fetch.AI has developed a number of corporate partnerships: it is a member of the **MOBI consortium**, a collaboration of car and OEM manufacturers working on the implementation of blockchain in the transportation and mobility industry. www.dlt.mobi

Fetch.AI is one of the founder members of **Artificial Intelligence Innovation Network** (AIIN). www.aii-network.org

In December 2018, Fetch.AI co-founded **Blockchain for Europe**, an association representing blockchain originating organisations in Europe, along with other thought leaders EMURGO/Cardano, NEM and Ripple. https://blockchain4europe.eu

At the same time, we will be engaging with the developer community to encourage technical implementation, experimentation and development of AEAs and those that are interested in creating nodes on the Fetch.AI network. Fetch.AI are planning an exciting series of technology meetups and technology workshops across the globe.

Planned milestones

Fetch.AI released its Ledger code during the late summer of 2018, followed by the code that drives its unique, smart-contract and synergetic computing platform. Fetch.AI delivered a private test network in Q4, 2018, with several hundred nodes. This network has been used for testing, agent and protocol development and preparing for broader network availability in Q1 and Q2 2019. Additionally, it has provided a vital test environment for AI development including the machine learning that delivers the trust and predictions required by autonomous economic agents and the digital world. Main network release, including a native Fetch.AI token, is planned for the end of 2019.

	Development	Commercial
Q1 2018	■ Technical Introduction White Paper	
Q2 2018	■ Economics White Paper ■ Ledger paper release	■ Private sale launch in Zurich ■ Joined MOBI consortium
Q3 2018	■ Scalable Ledger code release (as documented in the Q2 paper above). ■ Fetch.AI Virtual Machine initial release.	■ Global speaking and presentation tour at numerous AI / ML, Blockchain conferences around the world
Q4 2018	■ Core development of Virtual Machine for Smart Contract released, as Synergetic Computing functionality ■ Release of OEF code and SDK for agents ■ Seven patents filed	■ Commercial trials start with GE Healthcare ■ Initiated developer-centric meetups around the world ■ Founded Blockchain for Europe with other DLT thought leaders
Feb 2019	■ Development release: Access to private test network extended by invite for network participation users and test wallet users.	■ Fetch.AI public token sale within Binance
Apr 2019	■ Public test network: Full public test network with smart contracts. Includes enhanced Open Economic Framework ("OEF") with OEF search and connection capabilities.	■ Developer community support ■ Launch of Partner Accelerator program with commercial test sandbox prior to main-net launch
Jun 2019	■ Full Fetch.AI consensus[6], ledger-based native multi-party, multi-dependency auctions[7] and decentralized ledger computing	

---

FE
T C
H

	Development	Commercial
Jul 2019	■ Alpha release: Alpha[8] delivers the initial main-net OEF and ledger functionality with all major components of the Fetch.AI protocol and platform.	
Q2 2019	■ Beta release: All expected main-net functionality present and functional[9]. ■ Beta will extend out to the main-net release	■ Partner Accelerator Roadshow commences
End of Q4, 2019	■ Main-net: Initial release of the Fetch.AI main network powered by the Fetch.AI native token	

This development project represents our optimal plan. Whilst we have factored contingency into all of our development and commercial/academic partnership development, there is always the possibility that unforeseen circumstances could interfere with the schedule.

---

[8] Alpha Release: All major features functioning approximately as expected but with bugs and performance issues and not necessarily fully integrated

[9] Beta Release: Effectively complete: all features working as expected, but with tuning, optimisations and tweaks required
